Elastic Lab

You pulled on the elastic band and they stretched a distance,  $x$ . What did your graph look like? What was your slope?

$$F = 2.2 \frac{N}{cm} x$$

For a perfectly elastic object, the extension or compression ( $x$ ) causes an elastic force  $F_{\text{elastic}}$  opposing the change.

## Hooke's Law

$$F_{\text{elastic}} = -kx$$

the negative shows the direction of force is opposite the compression or extension,  $x$ .

$k$  is the elastic constant, that depends on the material and shape of the elastic object.

So, if your slope =  $2.2\text{N/cm}$ , then that is  $k$  for that elastic.

If you pulled that elastic  $4.4\text{N}$  of force, how far would it stretch?  $x = F/k = 4.4\text{N}/2.2\text{N/cm} = 2.0\text{cm}$  in the direction you pull it.

eg. I pulled an elastic  $5.0\text{ cm}$  and it pulled back with  $6.0\text{N}$  of force. I pulled a spring  $5.0\text{ cm}$  and it pulled back with  $3.0\text{N}$ .

- what is the elastic constant of each item?
- if I hang a  $1.0\text{ kg}$  mass on each, how far will it stretch? (not moving)
- if I pull the  $1.0\text{ kg}$  mass down  $2.0\text{ cm}$  more and let go, what is the acceleration of the mass?

## What is gravity?

# Newton and the apple.

a)  $k = F/x = 6\text{N}/5\text{cm} = 1.2 \text{ N/cm}$  elastic

$3\text{N}/5\text{cm} = 0.60 \text{ N/cm}$  spring

b)  $F_g = mg = 1.0\text{kg} \times 9.80\text{N/kg} = 9.8\text{N}$

$x = F/k = 9.8\text{N}/1.2\text{N/cm} = 8.16\text{cm} = 8.2\text{cm}$   
elastic band

$9.8/0.6 = 16.3333$  or  $16\text{cm}$  spring

$$F_{\text{net}} = ma = \Sigma F$$

$$F_e - F_g = ma$$

$$kx - mg = ma$$

$$(0.60\text{N/cm})(18\text{cm}) -$$

$$1.0\text{kg}(9.8\text{N/kg})$$

$$= 1.0\text{kg } a$$

$$a = (0.6 \times 18.333) - 9.8 = 1.2\text{m/s}^2$$

for the spring

$$(1.2 \times (8.2 + 2)) - 9.8 = 2.44$$

$$2.4 \text{ m/s}^2 \text{ for elastic}$$

# Gravity

What is gravity?

a force

Near Earth, the gravitational field strength,  $g$ , is  $9.8 \text{ N/kg}$ .

It depends on the mass of gravitational object, for example the Earth.

It also depends on how far are you from the object.

Newton: All objects with mass are pulled together everywhere in the universe.

Einstein: All masses warp space time causing attraction (and slight time warp).

Newton's universal gravitational equation:

$$F_g = mg = GMm/r^2$$

$$g = GM/r^2$$

$F_g$  is the gravitational attracting pulling any two masses together.

$M$  and  $m$  are any two masses in kg.

$r$  is the distance between the centre of the two

masses, in metres, m.

G is the universal gravitational constant  
 $6.67 \times 10^{-11} \text{Nm}^2/\text{kg}^2$  everywhere in the universe.

eg. 1. Show that g on Earth is  $9.8 \text{N/kg}$  given  
the mass of Earth is  $5.98 \times 10^{24} \text{kg}$  and the  
radius is  $6.38 \times 10^6 \text{m}$ .

2. What is force on the Earth pulling it towards  
the sun, if the mass of the sun is  $1.98 \times 10^{30} \text{kg}$   
and the distance is  $1.50 \times 10^{11} \text{m}$ .
3. What is the force attracting a  $50.0 \text{kg}$  student  
to a  $60.0 \text{kg}$  student  $1.5 \text{m}$  apart?

$$\begin{aligned} 1. \ g &= GM/r^2 = 6.67 \times 10^{-11} \text{Nm}^2/\text{kg}^2 \times 5.98 \times 10^{24} \text{kg} \\ &\quad / (6.38 \times 10^6 \text{m})^2 \\ &= 6.67 \text{E}-11 \times 5.98 \text{E}24 / ((6.38 \text{E}6) \times (6.38 \text{E}6)) = \\ &9.7991 = 9.8 \text{ N/kg} \end{aligned}$$

equations/givens:

$$F_{\text{net}} = ma = \sum F$$

$$F_g = mg = GMm/r^2$$

$$g = 9.8 \text{N/kg} \quad G = 6.67 \times 10^{-11} \text{Nm}^2/\text{kg}^2$$

$$F_f = \mu F_N$$

$$F_e = -kx$$

pulley equation - you should work out  
elevator equation too

$$F_g = mg = GMm/r^2$$

$$6.67\text{E-}11 \times 5.98\text{E}24 \times 1.98\text{E}30 / (1.5\text{E}11 \times 1.5\text{E}11) = 3.51\text{E}22$$

$3.51 \times 10^{22} \text{ N}$  of force pulling the Earth into the Sun

Block 2-4

Elastic Forces - not in book

Universal gravity (chap 8.1)

Individual Test Tuesday Nov 28

Momentum Thursday Nov 30 - marks

Elastic Lab

You pulled on the elastic band and they stretched a distance,  $x$ . What did your graph look like? What was your slope?

A red curved line representing a spring is at the top left. Two blue arrows point from the text 'quantities + units' to the units in the equation below. The equation  $F = 0.24 \frac{\text{N}}{\text{cm}} x$  is enclosed in a blue hand-drawn rectangular box.

$$F = 0.24 \frac{\text{N}}{\text{cm}} x$$

## Hooke's Law

For a perfectly elastic object, if you compress or stretch it a distance,  $x$ , it will respond with an elastic force,  $F_e$ , proportional to  $x$ .

$$F_e \propto x$$

$$\text{or } F_e = -kx$$

where  $k$  is the elastic constant, in  $\text{N/m}$  or  $\text{N/cm}$ ,  $k$  depends on the material and shape of the elastic object.

the negative sign indicates that the object pushes back opposite to  $x$ , the stretch.

so if  $k$  is  $0.24 \text{ N/cm}$ , if I pulled that elastic band with  $0.48 \text{ N}$  it would stretch  $2.0 \text{ cm}$

$$F = kx \quad x = F/k = 0.48 \text{ N} / 0.24 \text{ N/cm} = 2.0 \text{ cm}$$

eg. I pulled an elastic  $5.0 \text{ cm}$  and it pulled back with  $6.0 \text{ N}$  of force. I pulled a spring  $5.0 \text{ cm}$  and it pulled back with  $3.0 \text{ N}$ .

- what is the elastic constant of each item?
- if I hang a 1.0 kg mass on each, how far will it stretch? (not moving)
- if I pull the 1.0 kg mass down 2.0 cm more and let go, what is the acceleration of the mass?

What is gravity?  
Newton and the apple.

- $F = kx$  and  $F = 6.0\text{N}$  for the elastic  $x = 5.0\text{cm}$   
 $k = F/x = 6/5 = 1.2\text{ N/cm}$  elastic  
 $3/5 = 0.6 = 0.60\text{N/cm}$  spring (2 sig figs)

- $F_g = mg = 1.0\text{kg} \times 9.8\text{N/kg} = 9.8\text{N}$   
 if  $a = 0$  then  $F_g = F_e$   
 $9.8\text{N} = kx$   
 $x = 9.8/1.2 = 8.1667\text{ cm}$  for elastic = 8.2cm  
 $9.8/0.6 = 16.3333\text{ cm}$  for the spring = 16cm

- 2 more cm so elastic  $x = 8.2\text{cm} + 2\text{cm} = 10.1667\text{cm}$   
 for spring  $x = 16.333 + 2 = 18.333\text{ cm}$

$$F_{\text{net}} = ma = \sum F$$

$$ma = F_e - F_g$$

$$1\text{kg} \cdot a = (1.2 \times 10.2) - 9.8$$

$$a = 2.4 \text{ m/s}^2$$

$$N = \text{kg m/s}^2$$

↑ defined as

$$1 \text{ kg } a = \left( 0.60 \frac{\text{N}}{\text{cm}} \times 18.3 \text{ cm} \right) - 9.8 \text{ N}$$

$$a = 1.2 \text{ m/s}^2$$

## Gravity

What is gravity?

Pulls towards the Earth if you are near Earth.

$g$  is the gravitational field strength =  $9.8 \text{ N/kg}$  near Earth.

What if you are not near Earth?

Newton - Saw an apple fall, and thought, "why doesn't the moon fall?"

Answer: the moon falls but moves sideways fast enough to miss the Earth in its fall.

As you move away from the Earth, gravitational pull decreases. The moon has

less mass, so it has a lower gravitational pull than the Earth.

$$F_g = mg = GMm/r^2$$

$F_g$  is the force of gravity pulling any two masses together, in Newtons, N.

M and m are any two masses, in kg.

r is the distance between the centre of the masses, in metres, m (NOT km)

G is the gravitational constant - the same everywhere in the universe.

value of  $6.67 \times 10^{-11} \text{ Nm}^2/\text{kg}^2$

eg. what is g on Earth using Newton's equation and the mass of the Earth is  $5.98 \times 10^{24} \text{ kg}$  and the radius of the Earth is  $6.38 \times 10^6 \text{ m}$ ?

$$F_g = mg = GMm/r^2$$

$$g = GM/r^2 =$$

$$6.67 \text{E-}11 \times 5.98 \text{E}24 / (6.38 \text{E}6 \times 6.38 \text{E}6) = 9.7991$$

9.8N/kg cool

Homework - study

1. What is force on the Earth pulling it towards the sun, if the mass of the sun is  $1.98 \times 10^{30} \text{kg}$  and the distance is  $1.50 \times 10^{11} \text{m}$ .
2. What is the force attracting a 50.0kg student to a 60.0kg student 1.5 m apart?

## Block 2-2

Universal gravity (chap 8.1) go over chapter review problems

Group Test Friday

Individual Test Tuesday Nov 28

Momentum Thursday Nov 30 - marks

## Homework

What is the force of gravity pulling

- a) two students together, one 50.0 kg and one 60.0kg who are 1.5 m apart?

$$F_g = GMm/r^2$$

$$6.67 \times 10^{-11} \text{Nm}^2/\text{kg}^2 \times 50.0 \text{kg} \times 60.0 \text{kg} / (1.5 \text{m})^2$$

$$6.67 \times 50 \times 60 / (1.5 \times 1.5) = 8,893.3333$$

$$8.9 \times 10^{-8} \text{N}$$

- b) a 1.0kg mass towards the Earth, radius

$6.38 \times 10^6 \text{m}$  with a mass of  $5.98 \times 10^{24} \text{kg}$ .

$$\begin{aligned} F_g &= GMm/r^2 \\ &= 6.67 \times 10^{-11} \times 5.98 \times 10^{24} \times 1 / (6.38 \times 10^6)^2 = \\ &9.7991 \\ &= 9.8 \text{N} \end{aligned}$$

c) the Earth to the Sun,  $1.98 \times 10^{30} \text{kg}$   $1.5 \times 10^{11} \text{m}$  away.

$$\begin{aligned} F_g &= GMm/r^2 \\ &= \\ &6.67 \times 10^{-11} \times 5.98 \times 10^{24} \times 1.98 \times 10^{30} / (1.5 \times 10^{11})^2 = \\ &3.51 \times 10^{22} \text{ N} \end{aligned}$$

Why don't we fall into the sun? Why doesn't the moon fall on our heads?

What is  $g$  at the international space station, 400km above the surface of the Earth?

$$\cancel{mg} = G\cancel{M}\cancel{m}/r^2$$

$$\begin{aligned} g &= GM/r^2 = 6.67 \times 10^{-11} \times 5.98 \times 10^{24} / (6.38 \times 10^6 + 4 \times 10^5)^2 \\ &= 8.677 \\ &= 8.7 \text{N/kg or } 8.7 \text{m/s}^2 \end{aligned}$$

Why do they seem weightless?

p103

CR 2.1 - skydiver  $a=?$

after the parachute opens the skydiver slows down, so they must be accelerating up  
once they hit terminal velocity, they don't accelerate

CR 2.2 mass = 115kg  $W=F_g = mg = 115\text{kg} \times 9.8\text{N/kg} = 115 \times 9.8 = 1,127\text{ N}$

$F_{up}$  must be greater than the weight so it can accelerate up.

$F_{up} = F_g$  if you move it up at a constant speed

When Flo lifted Roberta, the normal force of the ground on her feet (reading on the scale) decreased.

$F_f = \mu F_N$  so if the normal force is reduced, then the frictional force used to run is reduced and your feet can slip.

equations:

$$F_{\text{net}} = ma = \sum F = F_{\text{up}} - F_{\text{down}} \text{ or } F_{\text{right}} - F_{\text{left}}$$

$$F_g = \text{weight} = mg = GMm/r^2$$

$$g = 9.8 \text{ N/kg near Earth} \quad G = 6.67 \times 10^{-11} \text{ Nm}^2/\text{kg}^2$$

$$F_f = \mu F_N$$

$$F_e = -kx$$

$$a = \frac{186 \text{ N}}{(5 + 11 + 19)} = 5.3 \text{ m/s}^2$$
